

FUSIO

Facet Fusion System

For More information or to see a live demo
please contact your local representative:

FUSIO

is commonly used for

- Pain from degeneration of the facet joint
- Patients suffering from spinal instability due to spondylothesis, Grade 1 or less
- Prevention of instability following spinal laminectomy/decompression procedures
- Adjunct to lumbar interbody fusion
- Adjunct to motion limiting devices
- Revisions to supplement segment stability after hardware removal or for failed/loosening hardware

The Fusio Facet Fusion System is contraindicated for patients who have gross spinal instability, greater than grade 1 spondylothesis, infection, tumor or severe osteoporosis.

Why is **FUSIO** a leading choice amongst all facet fusion products?

FUSIO is the only facet fusion system to utilize both a unique dowel geometry and a technique-based approach to prevent dowel migration.

Reengineering of the proprietary Anti-Migration Reamer allows the surgeon to create a custom shaped void deep in the facet joint while retaining the cortical rim. And when paired with the highly geometric dowel further prevents dowel migration, promotes spinal stability and an increased surface area for bony fusion.

FUS[®]O's advanced delivery system provides the surgeon an effective and reproducible solution for managing spinal instability and facet mediated low back.

- 
- ✓ Cost Effective
 - ✓ Decreased OR Time
 - ✓ Potentially reduced stay
 - ✓ Use of donor bone
 - ✓ Less Invasive
 - ✓ Doesn't interfere with future surgical options

FUSIO

Facet Fusion System

PREVENT

dowel migration

PROMOTE

increased fusion success

STABILIZE

the lumbar spine
